

MineColonies: War 'n Nobility

A configurable noble-rank and vassalage progression layer for MineColonies.

NeoForge 21.1.233 · Minecraft 1.21.1 | modid **warnnoblity** | v1.0.6 | by Barunn (NewtL) | needs MineColonies + War 'n Taxes

LIVE ON CURSEFORGE

War 'n Nobility turns a MineColonies server into a feudal ladder. Players climb an eight-rung title ladder, from Outsider to Emperor, by collecting **seals** of fealty from their peers. Voluntary seals are pledged in the Chancery; forced seals are taken by winning **War 'n Taxes** vassalization wars, so the wars a rival system actually fights are what promote you. Your growing county, duchy, or realm is drawn on the Antique Atlas map, decrees are issued from a Chancery Table block, and campaigns are planned on a wall-mounted War Table. The mod never edits another mod's code: every integration is reflection or a fail-soft Mixin that lives in this jar, so the ladder still runs when the optional partners are absent.

Everything is config. The ranks, their requirements, the vassal sentence, and the King gate are all in `warnnoblity-common.toml`. The mechanics follow the requirement column, not the title text, so you can rename titles or reshape the whole ladder without touching code.

Supported Versions

Loader	Minecraft	Mod version	Folder
NeoForge	1.21.1	1.0.6	/ (primary)
Forge	1.21.1	1.0.0	Forge variant (<code>WarNNobility</code>)

Crafting & Items

Chancery Table

The noble's console block.

G = Gold Ingot • L = Lectern • B = Writable Book

War Frame

One panel of the War Table; the recipe makes six.

S = Stick • P = Paper

Crown

The regalia consumed when a Duke claims the throne.

G = Gold Ingot • S = Shard from the Crown of Unification

The **Shard from the Crown of Unification** has no recipe on purpose. It is meant to be admin-granted or dropped by an out-of-band event (for example the POIs & Raid Bosses mod), so reaching King always needs more than crafting. Blocks appear in the Functional Blocks creative tab; the Shard and Crown appear in Ingredients.

Item	Display name	Notes
<code>chancery_table</code>	Chancery Table	Right-click to open your noble console
<code>war_frame</code>	War Frame	Item-frame-style panel; a 3x3 grid plus an atlas becomes a War Table
<code>crown_shard</code>	Shard from the Crown of Unification	No recipe; admin- or event-granted
<code>crown</code>	Crown	Crafted from a Shard; the King gate

Controls

This mod registers no keybinds of its own. It is driven by block interactions, and its RTS command layer reads Hundred Years War's own keys so the on-screen HUD always teaches your actual bindings.

Action	How
Open your noble console	Right-click a Chancery Table
Mount a War Frame	Use an atlas on a completed, like-facing 3x3 War Frame grid
Open the War Table planner	Right-click the War Table anchor frame
Rotate a flat War Table	Shift + right-click the table
View domain borders	Open the Antique Atlas map

Mechanics

The nobility ladder

The default ladder, lowest first, is Outsider → Artisan → Knight → Baron → Count → Duke → King → Emperor . Each rank declares how you *enter* it:

Requirement	How you advance into the rank
COMMAND	Just <code>/nobility promote</code> (hook quests, NPCs, or boss kills here). The early ranks use this
SUPPORT	A number of same-rank peers must pledge their seal to you; on promotion those sealers become your sentenced vassals
BUYIN	Pay a configured item, consumed on promotion (unused by the default ladder)
SCORE	Your score must have reached a threshold (unused by the default ladder)
CROWN	The King step: collect Duke seals, lead an Easy Factions faction over the claim threshold, and consume a Crown
HIGHEST	The Emperor seat. The first King is crowned automatically; after that the throne changes only by usurpation

In the default ladder Count needs 2 Baron seals, Duke needs 2 Count seals, and King needs 2 Duke seals. Each rank also carries a feminine title (Dame, Baroness, Countess, Duchess, Queen, Empress) that a player can switch to in the Chancery or with `/nobility gender`.

Seals and vassalage

A **seal** is a pledge of fealty. A peer pledges voluntarily with `/nobility seal` (revocable with `/nobility unseal`), or is forced to by a lost war. When a claimant with a `SUPPORT` or `CROWN` requirement promotes, the peers who sealed them become their **vassals**, bound for a sentence of real-world days (`vassal_sentence_days`, default 7) so players cannot vassal-hop to swing different lords' promotions. A bound player may `/renounce` only after the sentence is served.

War 'n Taxes drives the seals

When War 'n Taxes is installed, `WarTaxesBridge` polls its `VassalManager` and mirrors each colony vassalization into a nobility bond, so **winning War 'n Taxes wars is how you collect the same-rank seals that promote you**. A win does not immediately make the loser a vassal; it creates a *provisional seal* that converts to a sworn vassal when the winner next ascends, and the War 'n Taxes sentence timer carries over. A higher noble beating a lower one binds them immediately; a lower noble cannot bind their better. `VassalsPageMixin` tags each still-provisional colony **(Provisional)** in War 'n Taxes' own tax-book vassal page, drawn by War 'n Taxes with no change to its code.

Feudal war protection

With `protect_higher_rank_from_war` on, `WarSystemMixin` cancels a War 'n Taxes war declared on a colony whose owner outranks the declarer ("you may not make war upon your betters"). The attacker is told why and the declaration is suppressed; equal or lower rank is unaffected.

Renouncing a liege

A vassal past their sentence may `/renounce`. They keep their own title, but the break is open defiance: `ColonyHostility` marks the rebel HOSTILE in every colony the ex-liege owns, so MineColonies guards turn on them until the quarrel is settled.

The Emperor throne

Emperor is the `HIGHEST` seat. The first King to qualify is crowned automatically. After that the throne changes only through a usurpation challenge, fed in by external war or siege outcomes through `/nobility emperor ...`, so a challenger must actually take the sitting Emperor's imperial duchies to seize the crown.

Domains and the map

A Count and up commands a named domain, a **county**, then a **duchy**, then a **realm**, set with `/nobility domain`. When Antique Atlas 4 is installed, `DomainOverlay` draws each domain's borders and name labels straight onto the atlas screen through NeoForge screen events and reflection, with a plain-parchment fallback when the atlas is absent.

The Chancery Table

The Chancery Table is a noble's console. Right-click opens a rank-filtered panel where every action a noble can take, advance, seal, declare, name a domain, is a button that runs the same server-side logic as the matching command and then refreshes. Only the lines that matter at your rank are shown, derived from the ladder and overridable per rank in config.

The War Table

Six War Frames craft at once. Mounted like item frames, nine like-facing frames form a 3x3 grid; inserting an atlas activates it as a live, drawable briefing map with a shared view, a marker lock, and a persistent plan. A completed grid resists mining and takes three hits to dismantle, so nobody wipes a briefing mid-sentence. When Hundred Years War is present the board gains a Company-of-Heroes-style command layer over HYW's army units and freecam commander mode; it stays dormant otherwise.

Configuration

File: `config/warinnobility-common.toml`.

[ranks]

Key	Default	What it does
ladder	8-rank list	The nobility ladder, lowest first. Each line is <code>name; REQUIREMENT; param; entryScore; show; advanceText; femaleName</code> ; only the first four are required. <code>entryScore</code> is the score set on entering a rank (negative leaves it alone); <code>show</code> chooses which Chancery lines appear; <code>advanceText</code> is custom questline text

[vassalage]

Key	Default	What it does
vassal_sentence_days	7	Real-world days a vassal stays bound before it may break free (0 to 3650). Conquered vassals serve the same term once the conqueror ascends

[economy]

Key	Default	What it does
buyin_item	minecraft:emerald	Item consumed for a <code>BUYIN</code> promotion. Unused by the default ladder

[integration]

Key	Default	What it does
tribute_enabled	true	Bridge War 'n Taxes vassalization wars into seals. Harmless to leave true when War 'n Taxes or MineColonies is absent
tribute_poll_seconds	20	How often (seconds) to poll War 'n Taxes for new or ended vassalizations (1 to 600)
protect_higher_rank_from_war	true	Forbid declaring a War 'n Taxes war on a colony whose owner outranks the declarer. False lets anyone declare on anyone
king_requires_faction	true	King gate: the claimant must lead an Easy Factions faction. Skipped if Easy Factions is absent
king_faction_claim_threshold	50	King gate: total claimed chunks the claimant's faction must hold (0 to 1,000,000)
king_consume_crown	true	King gate: consume the Crown at coronation. False = the King only has to bear one

Compatibility

Integrations are reflection- or Mixin-based and fail-soft; the ladder runs standalone. Per `neoforge.mods.toml` the mod declares:

- **MineColonies** (required) — the colony system read for territory and the wars that drive seals.

- **War 'n Taxes** (required; its modid is `minecolonytax` , not `warntaxes`) — runs the vassalization wars whose outcomes become seals, and provides the tax book that gets the (Provisional) tag.
- **Antique Atlas 4** (optional, client) — the domain-border map overlay; falls back to plain parchment.
- **Easy Factions** (optional) — backs the King gate and the faction map overlay; the King gate stays dormant when it is absent.
- **Hundred Years War** (optional) — supplies the army units and freecam commander mode the War Table's command layer overlays.

Commands

All `/nobility ...` subcommands require permission level 2 (ops, command blocks, quest rewards). `/renounce` is player-facing.

- `/nobility promote|demote <player>` — advance or drop a rank
- `/nobility setrank <player> <rank>` — jump a player to any rank, ignoring requirements
- `/nobility setscore <player> <value>` — set a player's score
- `/nobility seal <supporter> <target>` / `/nobility unseal <supporter>` — pledge or revoke a voluntary seal
- `/nobility subjugate <aggressor> <defender>` — force a seal, the outcome of a vassalization war
- `/nobility vassal release <liege> <vassal>` / `/nobility vassal leave <vassal>` — end a bond
- `/nobility emperor throne|war|usurp|status <challenger> [...]` — feed throne and usurpation outcomes
- `/nobility gender <player> male|female` — switch a player's title form
- `/nobility domain <player> <name|clear>` — name or clear a domain (Count and up)
- `/nobility directive <rank> <text|clear>` — set custom "how to advance" text for a rank
- `/nobility info [player]` — print a player's title, domain, liege, vassals, seals, and next step
- `/renounce` — break from your liege once your sentence is served (turns the ex-liege's colonies hostile)

Building

Run `./gradlew build`. Requires a **JDK 21**. The proprietary dependency jars (MineColonies, War 'n Taxes, Easy Factions and their libraries) are **not** committed to this repo; they are `compileOnly` , so

supply them yourself and point Gradle at the folder that holds them via `deps_dir` (in `~/.gradle/gradle.properties` or `-Pdeps_dir=...`). The jar lands in `build/libs/warnnobility-neoforge-1.0.6.jar` .
